HOW TO CHOOSE YOUR DUST MOP

Dust Mop Attributes

Dust Pick-up

Dust pick up refers to the ability of a mop to remove dust and dirt from a surface. Synthetic and microfiber mops have the highest degree of dust pick up.

Launderability

Launderability is how many washing and drying cycles a dust mop can withstand before it starts falling apart and affecting performance. Synthetic, blended fiber and microfiber mops can be laundered more times, versus standard cotton mops, before they degrade.

Durability

The durability of a mop is a measure of how long it will perform before needing to be replaced. Synthetic and microfiber mops are the most durable.

Dust Mop Construction Features

Yarn

Choose Cotton, Synthetic or a Hybrid Microfiber/Synthetic. Cotton is economical, accepts dust treatment, and picks up large debris. Synthetic mops require no dust treatment, pick up and retain dust through static attraction, have excellent durability and good launderability. Hybrid yarns pick up and retain dust through static and tiny microfibers, are long-lasting and durable, and offer great launderability.

Backing Design

Slot pocket backing allows quick, easy setup for standard or breakdown mop frames.

Ends

Cut ends offer low initial cost and good dust pick up for general purpose dusting. Looped ends reduce tangling and fraying, have long durability vs. cut ends, and great launderability.
